CS6530 Course Project Phase 2 Completion and Final Assessment

Applied Cryptography | July-November 2026

Dear Students,

Greetings.

The course project now moves to final submission and assessment. This notice gives the complete requirements for the remaining project work, presentation, written viva, deadlines and allocation of the remaining 16 marks. Please use the coming week to close the project carefully and ensure that every team member understands the complete work.

Important dates

Item	Date and time
Final project deliverables	Monday, 2 November 2026, 11:59 PM IST
Project presentations	Tuesday, 3 November to Friday, 6 November 2026
Presentation slides	10:00 PM IST on the day before the assigned presentation
Individual written viva	Friday, 6 November 2026, after the final team presentation

Submission deadline. All three final project artefacts must be uploaded to Moodle by Monday, 2 November 2026, 11:59 PM IST. Submissions will not be accepted after this deadline.

Final project deliverables

Submit the following three artefacts. The report, technical artefacts, video and presentation must describe the same completed work.

Artefact 1 Completed technical report

The report must consolidate the understanding, analysis, experiments, evidence and engineering conclusions obtained from the project. It should clearly capture the outcomes of Activities 3 to 6 specified for the assigned project theme, while retaining the necessary context from Activities 1 and 2.

- Problem statement, primary-paper understanding and security objective
- Relevant system, protocol or security model and the threat or design analysis
- Analysis of the security failure and relevant supporting literature
- Configuration and experimental environment
- Reproduction, experiment or technical-study procedure
- Baseline result and supporting evidence
- Modified exploration and the resulting behaviour
- Selected logs, screenshots or outputs that support the findings
- Security Evolution Matrix
- Four or five engineering lessons
- Limitations, difficulties and deviations from the paper or prescribed experiment
- Brief statement of each member's contribution
- Brief declaration of generative-AI usage

Evidence must be selective and relevant. Do not include raw or excessive logs merely for completeness.

Artefact 2 Code scripts models and configuration

Submit the student-developed code, scripts, formal models, configuration files and relevant modifications used for the technical study, as applicable to the project. Clearly distinguish:

- author-provided or instructor-provided resources
- student modifications to those resources
- student-created code, scripts, models or configuration

Include a concise README containing prerequisites, setup and execution steps, expected outputs and the location of the important evidence.

Artefact 3 Short demonstration video

Submit a concise 5 to 8 minute video demonstrating the important technical work. The video should show the environment or context, baseline study or reproduction, observed result, modification or exploration, and resulting behaviour. The video provides evidence of work performed; it is not a second full project presentation.

Presentation schedule selection

The presentation schedule will be selected transparently in class using two bowls:

1. Bowl 1 will contain ten team slips: Team 1 to Team 10.
2. Bowl 2 will contain ten presentation-slot slips: Tue-1 to Tue-3, Wed-1 to Wed-3, Thu-1 to Thu-3 and Fri-1.
3. A volunteer will draw one team slip and one slot slip to form a pair.
4. Nine pairs will be drawn. The final unmatched team and slot will form the tenth pair automatically.
5. The complete team-to-slot mapping will be displayed and shared after the draw.

Presentation format

Time	Activity
0-10 minutes	Team presentation; a two-minute warning is given at 10 minutes
10-12 minutes	Team completes the presentation
12-14 minutes	Instructor and audience clarification questions
14-15 minutes	Close and transition to the next team

Time limit. The presentation will stop at 12 minutes even if some material remains. Clarification will close at 14 minutes.

Slide requirements

- A maximum of four content slides is permitted. A minimal title slide may be added and does not count toward the four content slides.
- The four content slides must collectively capture the six activities specified for the project theme.
- The slides must be consistent with the submitted report, technical artefacts and demonstration video.
- Use selected evidence and results. Do not overload the slides with text, logs or screenshots.
- Any video excerpt shown during the presentation counts within the 12-minute presentation time.

Slide submission

Upload the slides to the course Moodle page by 10:00 PM IST on the day before the team's assigned presentation. The submitted version will be copied to the classroom system and treated as the official presentation version. A replacement may be accepted only to correct a genuine factual, rendering or technical error, with prior instructor approval.

Speaking order and participation

For a three-member team, three slips numbered 1, 2 and 3 will be used. Each member will randomly pick one slip, and the team will present in that order. Every member must present at least one content slide and must be prepared to explain the complete project. The team may plan how the fourth content slide is shared or assigned. Two-member teams must ensure that both members present; a single-member team will present the complete work.

The questions after the presentation are for clarification. They are not the individual project viva.

Individual written viva

A 30-minute individual written viva will be conducted on Friday, 6 November 2026, after the final team presentation. Every student will answer questions about the student's own project. The assessment will cover:

- Project security objective and threat model
- Cryptographic or key-flow explanation
- One negative test and what its result demonstrated
- One failed assumption, limitation or implementation difficulty
- A project-specific question requiring the student to defend a design decision or proposed improvement

Questions 1 to 4 will have a common structure but must be answered using the student's own project. Question 5 will have team-coded variants. The written viva assesses individual understanding; marks may therefore differ among members of the same team.

Allocation of the remaining 16 project marks

Component	Marks	Assessment focus
Completed technical report	5	Technical depth and correctness; completion of Activities 3-6; analysis, results and evidence; engineering conclusions, limitations and clarity
Code scripts models configuration and evidence	3	Completeness, correctness, reproducibility, README quality, organization and clear distinction between supplied and student-created work
Demonstration video	2	Technical evidence of the completed work, baseline and modified exploration, observed results and clarity
Team presentation	2	Selection of key findings, consistency with the report and evidence, clarity, timing and participation
Individual written viva	4	Individual understanding of the security objective, threat model, cryptographic flow, negative testing, limitations and design decisions
Total remaining project marks	16	Phase 1 has already been assessed separately for 4 marks

Detailed assessment guidance

Component	Internal allocation
Completed technical report 5 marks	Technical completion and correctness: 2.0; security analysis and engineering synthesis: 1.25; experiments, results and evidence: 1.25; clarity, references, contribution statement and AI declaration: 0.5
Technical artefacts 3 marks	Correct and relevant artefacts: 1.25; reproducibility and README: 0.75; evidence and traceability to reported results: 0.5; organization and provenance of supplied, modified and created material: 0.5
Demonstration video 2 marks	Technical evidence and observed behaviour: 1.25; selection, organization and clarity: 0.75
Team presentation 2 marks	Selection and explanation of key findings: 1.0; clarity, timing and member participation: 1.0
Written viva 4 marks	Questions 1-4: 0.75 each; project-specific Question 5: 1.0

Contingency arrangements

The scheduled assessment mode will be used whenever possible. If an officially recognized disruption or documented illness prevents that mode, an equivalent alternative will be used without increasing the project scope. Students will not lose marks solely because an assessment could not be conducted for reasons outside their control.

Severe weather or institute-wide disruption

- A cancelled presentation will be rescheduled within the remaining presentation periods wherever feasible.
- If rescheduling is not feasible, the submitted four-slide deck and demonstration video will be used, together with a short narrated explanation in which every available team member participates. A second full technical demonstration will not be required.
- The individual written viva will be conducted in the earliest feasible common physical or timed online slot. If neither is possible before marks must be finalized, an equivalent individual project-specific written assessment will be announced.
- The submission deadline will remain unchanged when Moodle and normal connectivity remain available. If an officially announced disruption materially affects access, one common revised deadline will be announced for all affected teams.

Illness affecting a student or team

- The student or team must inform the instructor at the earliest feasible time and provide the documentation required under institute policy.
- If one member is ill, the team should normally submit and present as scheduled. The absent member's presentation contribution may be assessed from the submitted evidence or through a brief makeup interaction, and a written-viva makeup will be arranged where feasible.
- If the entire team is affected, the instructor will determine an appropriate short extension, rescheduled presentation or equivalent assessment using the submitted work.
- The contingency provisions apply only to officially recognized disruption, documented illness or another reason accepted under institute policy. Unexplained absence may result in loss of the corresponding assessment marks.

Final submission checklist

[ ] The completed report addresses all required project activities and includes selective evidence.

[ ] Code, scripts, models and configuration are organized and accompanied by a usable README.

[ ] Supplied resources, student modifications and student-created work are clearly distinguished.

[ ] The demonstration video is 5 to 8 minutes and shows the important technical evidence.

[ ] The contribution statement and generative-AI usage declaration are included.

[ ] All three artefacts are uploaded before the final deadline.

[ ] Every team member is prepared to present and answer the written viva independently.

Best wishes for completing the project carefully and presenting the most important evidence clearly.
